

**Cyber
Capability**

Case Study

Strategy & Policy

A machinery of government change that created a single portfolio agency, Cyber Capability undertook a comprehensive review of one of the funding and sustainment business cases to ensure that the new combined agency requirements were achieved. The program focused on the modernisation of the management of ICT business which required the underlying support of a comprehensive cyber assurance program to meet the needs and requirements of the integrity of core systems.

Following on from this review, an additional task was to bring the security programs together, Cyber Capability was responsible for the overall establishment and ongoing management of the cyber security strategy. In preparing for this task required a comprehensive review of all security requirements to form a new baseline of a security roadmap. This was then used to update the business case requirements and sustainment funding.

The review then formed the basis of strategy and work plan for the establishment of the Cyber Security Improvement Program which Cyber Capability managed, including the development and delivery

of the governance arrangement to manage the forward work program.

Cyber Capability facilitated all key artifact management and coordination with central agencies.

The Cyber Security NPP was successful in securing funding to reform and strengthen its Cyber Security operational functions to support the overall ICT transformational reform. This enabled the strengthening of the Portfolio security services to the new combined workforce.

Cyber Capability

The pace of change is not slowing.
We work and partner with experienced
people who are motivated to improve
government services and the enhancement of
national security outcomes for all Australians.
